## Foam Containers • Paper Containers &amp; Buckets

## GREEN TIP

Composting is the controlled, biological breakdown of solid organic waste material, and the conversion of it into a substance called compost. Composting requires the management of air, temperature, moisture and microorganisms, and the environmentally-friendly process can transform large quantities of waste products into much smaller amounts of beneficial materials, in a relatively short time. Compostable hot cups and lids are made with renewable resources like corn, with the compost often being reused by growers.

**GREEN TIP**

Individuals can save energy for the future and save money in the present with easy measures. For example, adjust home thermostats to reduce heating or cooling while the residents are out. Or form a carpool to save money on gas while reducing carbon emissions from cars. Also, consider small home electronic adjustments. Some electronic devices continue to draw power even when switched off. Either unplugging appliances when not in use or plugging devices into a smart power strip will cut down on wasted energy. Consider these small steps to save money and energy both for now and later.
